

## Problem 1

City A has a latitude of  $65^{\circ} 29' 56''$  N      City B has a latitude of  $20^{\circ} 59' 15''$  N

City A is due north of City B

1. Determine how far apart these cities are from each other if we assume radius of earth is about 4000 miles

a. What is the difference in latitude measures in DMS?

$$44^{\circ} 30' 41''$$

b. What is the difference in latitude measures in DD?

$$= 44 \frac{1841}{3600} {}^{\circ} \approx 44.511389 {}^{\circ}$$

c. What is radian measure of the latitude difference?

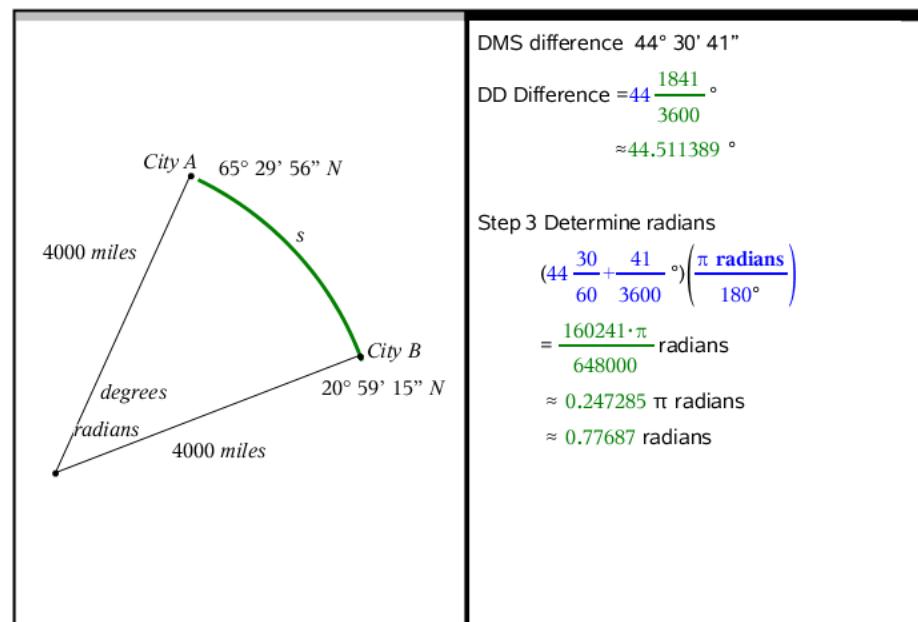

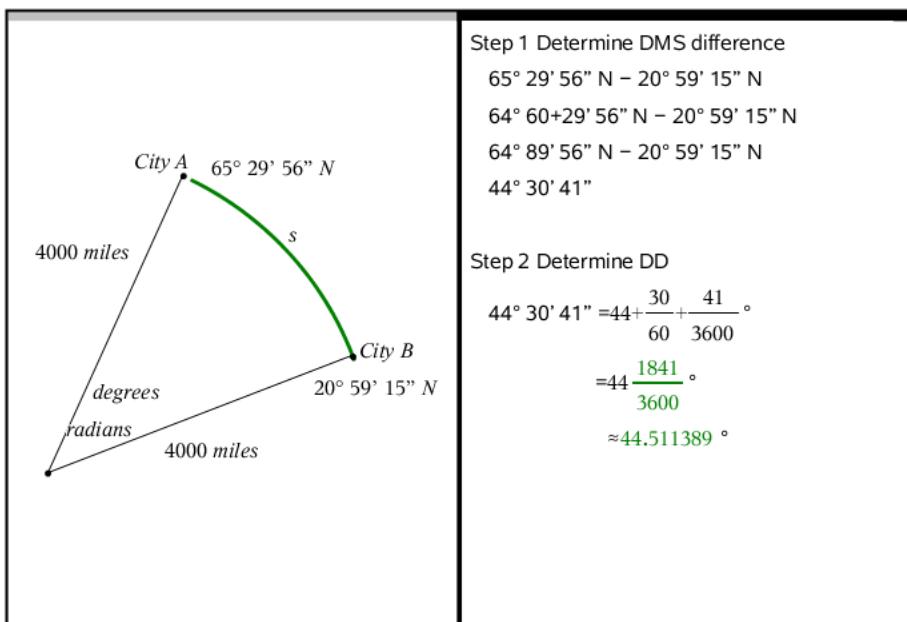

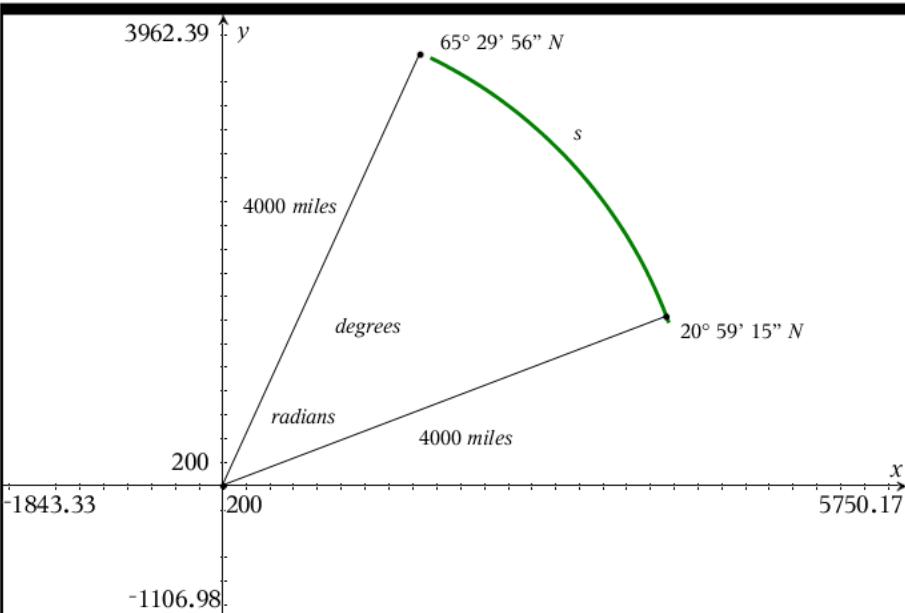

$$= \frac{160241 \cdot \pi}{648000} \text{ radians} \approx 0.247285 \pi \text{ radians} \approx 0.77687 \text{ radians}$$

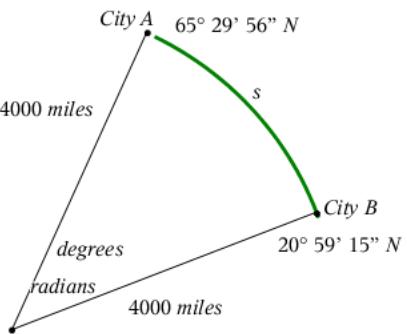

d. What is the EXACT distance between cities?

$$= \frac{160241}{162} \pi \text{ miles}$$

e. What is the APPROXIMATE distance between cities?

$$\approx 989.142 \pi \text{ miles} \approx 3107.481163 \text{ miles}$$

DMS difference  $44^{\circ} 30' 41''$

$$\text{DD Difference} = 44 \frac{30}{60} + \frac{41}{3600}^{\circ}$$

$$\approx 44 + \frac{30}{60} + \frac{41}{3600}^{\circ}$$

Radian Difference

$$= \frac{160241 \cdot \pi}{648000} \text{ radians}$$

$$\approx 0.247285 \pi \text{ radians}$$

$$\approx 0.77687 \text{ radians}$$

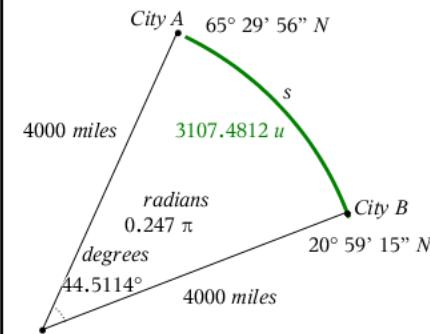

$$s = \theta \cdot r$$

$$= \left( \frac{160241 \cdot \pi}{648000} \right) (4000)$$

$$= \frac{160241}{162} \pi \text{ miles}$$

$$\approx 989.142 \pi \text{ miles}$$

$$\approx 3107.481163 \text{ miles}$$

DMS difference  $44^{\circ} 30' 41''$

$$\text{DD Difference} = 44 \frac{1841}{3600}^{\circ}$$

$$\approx 44.511389^{\circ}$$

Radian Difference

$$= \frac{160241 \cdot \pi}{648000} \text{ radians}$$

$$\approx 0.247285 \pi \text{ radians}$$

$$\approx 0.77687 \text{ radians}$$

$$s = \theta \cdot r$$

$$= (0.777)(4000)$$

$$\approx 3108. \text{ miles}$$

$$s = \theta \cdot r$$

$$= (0.247 \cdot \pi)(4000)$$

$$\approx 3103.893542 \text{ miles}$$
